

Dhanu Enterprise – M.P.Coir Exports

Production Capacity

- We have one of the high production Hydraulic baling press(Which is manufactured by our parent company) which is producing 22-25 bales of weight 120-125kgs of size.
- This works around 2.6Tons to 3.2 Tons of fiber per hour. We work for 16hours per day in 2 shifts which will give a output of 48Tons per day.
- One 40' HC Container roughly holds around 23Tons. Hence 2 containers per day.

Quality Methods

- we work closely with our coir fiber suppliers to make them understand the importance of good quality.
- We use two methods to check the moisture level one is the **Quick method** where we use 2pin moisture meter.
- Other method is **Manual method** where the sample is weighted and made it to dry in sun for 5 hours and again weigh the fiber. The moisture level is calculated based on the weight lost after drying.
